

To manage passwords stored on the computer

What if a user accidentally commands the computer to remember a password?

Windows allows you to store the different user names and passwords you use to access resources on a network, another computer, or the Internet in one place: Stored User Names and Passwords.

The steps to perform this task differ depending on whether your computer is a member of a network domain or is part of a workgroup (or is a stand-alone computer).

My computer is on a domain

You must be logged on as an administrator or a member of the Administrators group in order to complete this procedure. If your computer is connected to a network, network policy settings might also prevent you from completing this procedure.

1. Open **User Accounts** in **Control Panel**.
2. On the **Advanced** tab, in **Passwords and .NET Passport**s, click **Manage Passwords**.
3. You can now add a user name and password you use to access a resource, **OR** edit or **remove an existing entry**.
